SVC Implementation Order

> *Build order for the three epics filed on 2026-11-02 (SVC-406, SVC-407, SVC-435) and their 35 stories. Dependencies drive the order — follow it top-to-bottom and nothing waits on something that isn't done.*

All 35 stories are assigned to Tushar.

Epic order

1. **SVC-407** — Admin console. Unblocks everything else.
2. **SVC-406** — Marketplace pricing. Needs admin's pricing config (SVC-428) live first.
3. **SVC-435** — Service addition. Needs admin shell + marketplace pricing before it has value.

SVC-407 — Admin console

> *Rip-and-replace of the make-shift admin. Also unlocks pricing config + review queue surfaces the other two epics assume.*

1. **SVC-421** — Scaffold. Everything else lives inside this shell.
2. **SVC-422** — Auth + RBAC (email/pw + TOTP, 3 roles). Gates every write.
3. **SVC-423** — Audit log. Required middleware for every write surface after this.
4. **SVC-424** — Migrate KYC queue. First real surface — unblocks SP verification in the new app.
5. **SVC-425** — Migrate bookings lookup.
6. **SVC-426** — Migrate payouts dashboard.
7. **SVC-427** — SP + Pro directory (adds Pro as first-class per SVC-318).
8. **SVC-428** — Pricing config surface. **Hard gate for SVC-406.**
9. **SVC-429** — Coupon management (replaces the SQL-insert flow we used for EXPO25/FIRST100).
10. **SVC-430** — Service catalog management.
11. **SVC-431** — Refund + dispute workflow.
12. **SVC-432** — Analytics shell + GMV/supply dashboards.
13. **SVC-433** — Support console (lookup-first).
14. **SVC-434** — Decommission inline admin. Last — only after ops has used the new app for 7 days.

SVC-406 — Marketplace pricing

> *SP-set prices, customer-choice marketplace. The big product bet. Can start on SVC-408 the moment SVC-428 (admin pricing config) is live.*

1. **SVC-408** — Data model + migrations. Every other story imports from this.
2. **SVC-409** — Ranking endpoint (composite score + PostGIS geo filter). Core backend logic.
3. **SVC-414** — Boost activation hook on KYC pass. Small; land anywhere after SVC-408.
4. **SVC-410** — Dynamic commission + Razorpay Route rework. Payments-critical.
5. **SVC-411** — Price lock + sheet TTL. Blocks cart integration.
6. **SVC-412** — SP pricing surface. SPs set their own prices.
7. **SVC-413** — SP competitive view (aggregated). Parallel with SVC-412.
8. **SVC-415** — Service tile "from ₹X" on customer home.
9. **SVC-416** — Pro-selection bottom sheet. Central customer UX of the marketplace.
10. **SVC-417** — Cart + checkout honors locked price.
11. **SVC-418** — Data migration backfill. Runs just before launch, not during dev.
12. **SVC-419** — Analytics instrumentation. Feeds dashboard + ranking-formula tuning.

13. **SVC-420** — E2E test. Gates launch — don't ship if this fails.

SVC-435 — Service addition

> *Open catalog, admin-queued approval. The "any service, come on board" expo pitch, operationalized. Starts after SVC-421-423 (admin shell + auth + audit).*

1. **SVC-436** — Data model (service_requests, SP quota, spam-ban table).
2. **SVC-437** — Duplicate detection (pg_trgm now, swappable for AI later).
3. **SVC-438** — SP "Request a service" flow with inline suggestions.
4. **SVC-440** — Admin review queue (list + detail + 3-action panel).
5. **SVC-441** — Admin approve action (creates service + auto-adds to proposing SP).
6. **SVC-442** — Admin reject-with-reason + reject-with-recommendation.
7. **SVC-439** — SP status tracker + notifications. Depends on SVC-440 to SVC-442 producing the resolutions it reads.
8. **SVC-443** — Analytics for service-request metrics.

Notes

- **Tushar**: pick tickets top-down. Within an epic, treat the order as serial unless the "parallel with X" hint lets you overlap. Every ticket already has baked defaults for ergonomic decisions — build to spec, override via PR comment only if a default is actually wrong.
- **Vipul**: the one Vipul-flavored decision baked into tickets is SVC-428 — the initial sensitive-vs-commodity classification per category + bounds %. Default proposal is in the ticket; you can override at approval time via the admin UI, or redline the ticket now.
- **Spike reference**: SVC-405 — all SVC-406 design decisions trace back here.
